Sequence 10. 626834

Patent No. 626834

GENERAL INFORMATION:

APPLICANT: La Thangue, Nicholas B

APPLICANT: Bandara, Lasantha R

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

FILE REFERENCE: 620-67

CURRENT PAPLICATION NUMBER: US/09/308,935

CURRENT FILING DATE: 1999-05-27

EARLIER FILING DATE: 1997-12-22

EARLIER FILING DATE: 1996-12-20

NUMBER OF SEQ ID NOS: 18

SEQ ID NO 5

Fatent No. 626834
GENERAL INFORMATION:
APPLICANT: La Thangue, Nicholas B
APPLICANT: La Thangue, Nicholas B
APPLICANT: Bandara, Lesantha R
TITLE OF INVENTION: Peptide antagonists of DP transcription factors
FILE REPRENCE: 620-67
CURRENT APPLICATION NUMBER: US/09/308,935
CURRENT FILING DATE: 1995-05-27
EARLIER APPLICATION NUMBER: PCT/GB97/03506
EARLIER APPLICATION NUMBER: PCT/GB97/03506
EARLIER APPLICATION NUMBER: 1997-12-20
MUMBER OF SEQ ID NOS: 18
SOFTWARE: PatentIN Ver. 2.1
SEQ ID NO 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                        Peptide H7 comprises amino acid residues 170-199 in the DEF box (C (I) (see AAW30501) of transcription factor DP1. Claimed peptides (I) (see AAW30501) of transcription factor DP1. Claimed peptides (C (II) (see AAW30504-07) containing one or both of 2 motifis (see CAM30502-03) of the DEF box are capable of antagonising the certained are variants of these peptides, especially containing subscriptions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and a corresponding (I)-(III) are used (III) and host cells. (I)-(III) are used (III) and host cells. (I)-(III) are used to therapeutically to induce apoptosis, specifically in tumour or therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells either in vivo or in vitro, e-g. for purging cordiovascular cells either in vivo or in vitro, e-g. for purging (I)-(III) are used to cardiovascular sents comprising (I)-(III) are used to angioplasty. (I)-(III) function by inactivating the DNA-binding catavity of DP-1/E2F heterodimers. They are also used as research capants, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunosassy agents. C encoding (I)-(III) to control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells, particularly by control DP levels in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                         Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

peptide H (I) comprises residues 163-199, i.e. the DEF box region, of transcription factor DPI. Claimed fragments (II) (see AAW30502-07) of (I) are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are fusion proteins (III) comprising (I) or (II) and amembrane translocation sequence (see AAW30508), expression vectors encoding (I) (III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, expression specifically in tumour or acadiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding activity of EP/E2P heterodimers. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                have undergone angioplasty. (1)-(III) function by inactivating the DNA-binding activity of DP/22P heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic caids encoding (1)-(III) to control DP levels in cells, particularly by gene therapy. When formulated with cytotoxic or cytostatic agents, (1)-(III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.

useful for e.g. altering cell proliferation characteristic such as to alter plant cell, organ or tissue size (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle, and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be medulated to alter plant cell, organ or tissue shape, and alter plant cell, organ or tissue state cateristic such as to alter plant cell, organ or tissue size. New isolated, enriched, cell free and/or recombinant nucleic acid AAB67764-68 represent fragments of a wheat E2F-dimerisation Length 56; Indels Match 65.1%; Score 99; DB 22; L.                                                                                                                                                                                This sequence represents 42% of the middle region of soybean cell cycle regulatory protein DP-1, as deduced from an isolated cycle regulatory protein DP-1, as deduced from an isolated cond. Conno. (see AAZ34575-81) and invention relates to nucleic acid fragments (see AAZ34575-83) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory proteins (see AAY32159-67). It also relates to the construction of a chimeric gene encoding all or a contentation, where expression of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein in the atransformed host cell. The nucleic acids and protein in cused to facilitate studies of cell cycle regulation in plants, cused to facilitate studies of cell cycle regulation in plants, cused transfer efficiency and provide more stable.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                         transformations. The proteins may also provide targets to facilitate design and/or identification of cell cycle regulatory proteins that may be useful as herbicides.

```
The invention relates to a novel cell cycle protein (CCP) and the polynuclectides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the eleptoperide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; motif.

                                                                                                                                                                                                                                                                      Peptide H4 comprises amino acid residues 185-199 in the DEF box region (see AAM30501) of transcription factor DP1. Unlike claimed peptides (see AAM30504-07) that contain one or both of 2 motifs (see AAM30502-03) of the DP1 DEF box, peptide H4 is not capable of antagonising the heterodimerisation of a DP protein with an E2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. to prevent restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                            Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

cc maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola.

CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of creat disorders characterised by insufficient or excessive production of corporate that bind to or modulate the activity compounds that bind to or modulate the activity of CCP polymeucleotide is useful for modifying cell fate, plant development, of CCP plant morphology, biochemistry and/or physiology, the length of the G1, C. S. G2 and/or M phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, ced development, nodule function, dwarfism in plants, ced size, seed development, nodule function, dwarfism in plants, cand the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due continuental conditions, including abiotic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant architecture, plant quality traits, plant controduction and seed development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to expressing CCP protein, to detect CCP mRNA, or a generic represents a motif which may be found in a CCP protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour;

Peptide H2 comprises amino acid residues 166-184 in the DEP box (II) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07).containing one or both of 2 mortifs (see AAW30502-03) of the DEP box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprishing (I) cit (III) and host cells. (I) -(III) are used cherapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding creativity of DP/E2P heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-1/E2P dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) enhance cell killing. (I)-(III) enhance cell killing.
               Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DP-1; transcription factor; antagonist, E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour;

Peptide H5 comprises amino acid residues 168-183 in the DEF box (I) (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifs (see AAW30502-03) of the DEF box are capable of antagonising the cheerodimerisation of a DP protein with an E2F protein. Also heterodimerisation of a PP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues orresponding to residues 167, 169, 171 and host cells (III) comprising (I) or (II) and host cells. (II-(III) are used cherapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to read or prevent restnesses in patients who have undergone treat or prevent restnesses in patients who have undergone activity of DP/E2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying activity of DP/E2F dimerisation and as immunosassy agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) thoriton DP levels in cells, particularly by the farmalated with cytotoxic or cytostatic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                E2F activity; inhibitor; treatment; tumour; arteriosclerosis

                                                                                                                                                                                                                             Peptide HZmtl is based on peptide HZ (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. The HZmtl peptide, in which HZ residues corresponding to DP1 residues Val169 and Val175 are substituted by Ala residues, behaves in a similar fashion to the wild-type HZ peptide in its ability to inactivate EZF site DNA binding activity in D9 EC cell extracts. HZ is an antagonist of the heterodimerisation of DP1 with EZF. Thus, the Val-169 and Val-175 residues of HZ play little role in this activity. HZ and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.

is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoy1, alloy1, hetero-arylcarbony1, alkoy2, aryloxycarbony1, hetero-arylcarbony1, or M. R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2P activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This represents a compound that can inhibit E2F activity. The compound alkanoyl, alloyl, hetero-arylcarbonyl, alkoycarbonyl, aryloxycarbonyl, hetero-arylcarbonyl, alkoyl, respectively, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide H2mt2 is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. In H2mt2, amino acid residues of H2 that correspond to DP1 residues Arginf7 and Asp171 are substituted by Ala residues. H2 is an antagonist of the heterodimerisation of DP1 with B2F. H2mt2 retains some, but not all, of this antagonistic activity. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Peptide HZmt3 is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. In HZmt3, amino acid residues of H2 that correspond to DP1 residues Ieu173 and Leu176 are substituted by Arg residues. H2 is an antagonist of the heterodimerisation of DP1 with E2F. H2mt3 has none of the antagonistic activity of H2. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         39.5%; Score 60; DB 19; Length 19; 86.7%; Pred. New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators -

Example 10; Page 285; 316pp; English.

The invention relates to a novel cell cycle protein (CCP) and the copynuclectides encoding them. CCP is useful for identifying a compound witch modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell and polypeptide and sarbidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, contoled and polypeptide molecules are useful as modulating cell copynomic and candle or regulation of CCP protein forms which have decreased or treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CC copynomic of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CC copynomic of CCP protein forms which have decreased or copynomic of CCP protein forms which in the activity of a protein forms which intitation, promulated is useful for modifying cell fate, plant development, the polymodic order of the cell cycle of a plant, initiation, promotion, seed size, seed development, tuber, fruit, leaf formation, shoot and rock sensions. And/or physiology, the length of the GC seed size, seed development, to development, to actress CCP, the polymodiccide and the anti-CCP antibody are useful in agriculture to modulate the cold, nutrient deprivation, heat, drought, salt stress such as cold, nutrient deprivation, heat, drought, salt stress or biotic cold, nutrient deprivation, heat, drought, salt stress, or biotic cold, nutrient deprivation, heat, drought, salt stress, or biotic cold, nutrient deprivation, heat, drought, salt stress, or biotic cold, nutrient deprivation, or enhance plant architecture, plant quality traits, plant creased cold attenuate plant architecture, plant quality and so the substrate of secand or serving or secand or secand or secand or secand o

The present invention relates to a new meeting of modulating expression that includes a TERT promoter and a Site C repressor binding site. The method of the invention involves modulating TERT transcription repression by the Site C repressor binding site. The method of the invention is cuseful for modulating expression of TERT for producing a mammalian attributes. The method of the invention is useful for method is also useful in a variety of different applications, including immortalisation of cells, production of reagents for use in life science research, therapeutic applications, and therapeutic agent screening applications. Increasing TERT expression delays natural telomeric shortening and/or increases telomeric length and is useful for treating disease conditions such as Progeria or Hutchinson-Gilford syndrome, acquired immunodeficiency syndrome (AIDS), cardiovascular disease, osteoporosis, in skin rejuvenation and to inhibit immune senescence. The method can be employed to lengthen telomerse of osteoblast and osteoclast stem cells, encouraging bone replacement and proper remodeling and reinforcement, and can thus be used in bone marrow transplants for the treatment of cancer and skin grafts for burn victims and as such the method improves the survival and effectiveness of bone marrow and skin cell transplants. Decreasing TERT expression is useful for treating cellular proliferative disease conditions, including cellular proliferative disease conditions, including cequence represents the human DNA binding domain E2F-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention relates to a new method of modulating expression

                                                                                                                                                                                                                                                                                                                                                                        Peptide H6 comprises amino acid residues 167-180 in the DEF box region (see AAW30501) of transcription factor DP1. Unlike claimed peptides (see AAW30504-07) that contain one or both of 2 motifs (see AAW30502-03) of the DP1 DEF box, peptide H6 is not capable of antagonising the heterodimerisation of a DP protein with an E2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. to prevent restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                          Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human musculoskeletal system related polypeptide SEQ ID NO 1380.

                                                                                                                                                                                                                                                              The invention relates to novel genes (AALJ4669-AALJ7666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, of gastrointestinal tract, luyer, lung, or urogenital; (b) immune asservants and search and search and sisease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myccardial isochaemias; (d) wound the soling; (e) neurological diseases e.g. cerebral anoxia and epilepsy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                         Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    healing; (e) neurological diseases e.g. cerebral anoxia and epile
and (f) infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                      Claim 11; SEQ ID NO 1380; 781pp + Sequence Listing; English.

or humans. The nucleic acid: stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, post-operative tissue repair, and ulcers; stimulates angiogenesis con ulcus, sock-operative tissue repair, and ulcers; stimulates angiogenesis conditions, such as, Alzheimer's disease, Parkinson's disease, and limb regeneration; stimulates conditions, such as, Alzheimer's disease, Parkinson's disease, and Albs-related complex; stimulates chondrocyte growth, thus they can be conditions, such as, Alzheimer's disease, Parkinson's disease, transports or bone grafts; prevents skin aging due to subburn by transports or bone grafts; prevents skin aging due to subburn by constitution grafts and promotes melanocyte growth; stimulates growth and differentiation of hematopoietic cells and bone constructed and differentiation of for supporting cells and bone constructed incombination with other cytokines; maintains organs before transplantation or for supporting cells and bone constructed increases or decreases the differentiation or proliferation of embryos; increases or decreases the differentiation or proliferation of embryos; increases or decreases the differentiation, size, and shape colour, skin, percentage of adipose tissue, pigmentation, size, and shape colour, skin, percentage of adipose tissue, pigmentation, size, and shape colour, skin, percentage of adipose tissue, pigmentation, size, and shape carteadic integery); modulates mammalian elements of printies of carteadic rhythms, depression, tendency for violence, tolerance for pain, carteadic rhythms, depression, tendency for violence, tolerance for printed specification, but was obtained in electronic format directly format directly format the sequence date for this patent did not form part of the parent of the parent of the patent of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; telomerase reverse transcriptase; TERT; Site C; Progeria; burn; repressor binding site; Hutchinson-Gilford syndrome; AIDS; cancer; acquired immunodeficiency syndrome; cardiovascular disease; osteoporosis; skin rejuvenation; immune senescence, bone marrow transplant; skin graft; neoplastic disease; TERT minimal promoter; DNA binding domain; E2F-4.

                                                                                                                                                                                                                     of telomerase reverse transcriptus (TERN) from a TERT expression system controlleds a TERT promoter and a Site C repressor binding site. The method of the invention involves modulating TERT transcription repression by the Site C repressor binding site. The method of the invention is useful for modulating expression of TERT for producing a mammalian antibody. The method is also useful in a variety of different applications, including immortalisation of cells, production of reagents of the repension of the reagents applications. Increasing TERT expression therapeutic agent exceening applications. Increasing TERT expression delays natural telomeric shortening and/or increasing TERT expression is useful for treating disease conditions such as Progeria or Hutchinson-Gilford syndrome, acquired immunodeficiency syndrome (AIDS), cardiovascular disease, osteoporosis, in skin rejuvenation and to inhibit immune sensecence. The method can be employed to lengthen telomerse of osteoblast and osteoclast stem cells, encouraging bour replacement and proper remodeling and reinforcement, and can thus be used in bone marrow transplants for the treatment of cancer and skin grafts for burn anyther and every victime and as such the method improves the survival and effectiveness of
                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful for treating cellular proliferative disease conditions, including neoplastic disease conditions e.g. cancer. The present amino acid sequence represents the human DNA binding domain E2F-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Telomerase reverse transcriptase; TERT; Site C repressor; transcription; cytostatic; immunostimulant; anti-HIV; vulnerary; telomerase; human;
                                                                                                                                                                                                             present invention relates to a new method of modulating expression
                                                                                                                 Modulating expression of telomerase reverse transcriptase (TERT) in scell, for regulating proliferative capacity of a cell, involves modulating TERT transcription repression by Site C repressor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        33.2%; Score 50.5; DB 23; Length 76; 42.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to modulating expression of telomerase reverse transcriptase (TERT) expression system that includes a TERT promoter as Site C repressor binding site. The method involves modulating TERT transcription repression by the Site C repressor binding site. The methods and compositions of the present invention are useful for the immortalization of cells, production of reagents in life science research, therapeutic agent screening applications, diagnosis and treatment of disorders associated with aberrant telomerase activity su as cancer, Progeria, immune senescence, HIV, and in skin rejuvenation. The present sequence represents the DNA binding domain of a repressor

The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis,
                                                                         This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                    Gaps
activity inhibitors - for treatment and prevention of tumours arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia;
hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analysing gene expression in human adult liver
                                                                                                                                                                                                                                                                                     ö

The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
               is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #10814 encoded by probe for measuring placental gene expression.
                                 Human; bone marrow expressed exon; gene expression analysis; probe;
microarray; cancer; leukaemia; lymphoma; myeloma.
Human bone marrow expressed probe encoded protein SEQ ID NO: 36978.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        probes which are derived from enables expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                    Human brain expressed single exon probe encoded protein SEQ ID NO: 35964.

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human peptide encoded by genome-derived single exon probe SEQ ID 35546.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a cample derived from human lung; measuring gene expression in a cample derived from human lung; comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising of the eukaryote; and (b) detecting at least one exon from genomic sequences of the eukaryote; and (b) detecting at least one exon from genomic sequences of the eukaryote; and probe is included in the above mentioned microarray; assigning exons to a single exon probe; in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons to a single exon in the above mentioned microarray; assigning exons in the probe is included comprising (a) identifying exons from genomic sequence by the method contrary and the axons in the tissues and/or cell types using hybridisation, or encoded by the expression of the exons in the tissues and/or cell types indicates the exons should be assigned to a single gene; a peptide comprising one of 1011 sequences, mentioned in the specification, or encoded by the manylais, and for identifying exons in a gene, particularly cusing human lung derived mikh and for the study of lung disease (OPD), interstitial lung disease (LID), familial idiopathic pulmonary alveolar protein probes are used for gene probes of microded by a single 
                                                                               Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            te: The sequence data for this patent did not form part
the printed specification, but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                This sequence represents 10% of the middle region of soybean cell cycle regulatory protein E2F, as deduced from an isolated C coll cycle regulatory protein E2F, as deduced from an isolated C coll cycle (Fig. 1992). The invention relates to nucleic acid fragments (see AAZ34575-83) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory proteins (see AAY3155-67). It also creates to the construction of a chimeric gene encoding all or a portion of the cell cycle regulatory protein, in sense or antisense corientation, where expression of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein in a transformed host cell. The nucleic acids and proteins may be used to facilitate studies of cell cycle regulation in plants, convide genetic tools to enhance cell growth in tissue culture, concrease gene transfer efficiency and provide more stable transformations. The proteins may also provide targets to facilitate design and/or identification of cell cycle regulatory corrections that may be useful as herbicides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a peptide comprising DNA-binding domain of wheat ESF protein that was identified in a wheat cDNA library by yeast two-hybrid screening. The E2F is a transcription factor that interacts with plant retinoblastoma (Rb) and is involved in cell cycle regulation. The present sequence has the ability to bind to E2F binding site in plant DNA and is used to control plant growth, cellular DNA replication, cell cycle progression, differentiation and development by altering its DNA-binding

                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                                                                                                                                                         streptococcus/GBS (Streptococcus agalacties) or group A streptococcus/GBS (Streptococcus/GBS GBS GBS), given in the proteins have antibacterial and antibiliammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71256 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detecrmine whether a compound binds to (I). A composition comprising (I) on a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromosomy and distinguishing/identifying

                                                                                                                                                                                                     This peptide comprises amino acid residues 175-183 in the DEF box region (see AAW30501) of transcription factor DP1. Claimed peptides (11) (see AAW30502-07) containing this and/or another motif (see AAW30503) of the DEF box, are antagonists of the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues of corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (1) or (II) and a membrane translocation sequence (see AAW30508), expression vectors encoding (1)-(III) and specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical sents comprising (1)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical sents comprising (1)-(III) are used therapeutically to induce apoptosis, thave undergone angioplasty. (1)-(III) function by inactivating the binding activity of DP/E2F heterodimers. They are also indentifying antagonists, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids encoding (1)-(III) to control DP levels in cells, or cytostatic agents, (1)-(III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; cancer; tumour; developmental abnormality; foetal deficiency; blood disorder; immune system disorder; inflammation; autoimmune disease; allergy; Alzheimer's disease; cognitative disorder; schizophrenia; arthritis; asthma; psoriasis; sepsis; skin disorder; atherosclerosis; diabetes; cardiovascular disorder; disorder; endocrine disorder; infection; AlDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 9;

    AAX97916 to AAX98029 represent 110 isolated human secreted protein
genes. AAY36224 to AAY36727 represent the secreted proteins encoded by
the 110 human genes. The genes and their corresponding secreted
polypeptides are useful for preventing, treating or ameliorating medical
conditions, e.g. by protein or gene therapy. Also pathological conditions
can be diagnosed by determining the amount of the new polypeptides in a
sample or by determining the presence of mutations in the new genes.
Specific uses are described for each of the 110 genes, based on which
itssues they are most highly expressed in, and include developing
products for the diagnosis or treatment of cancer, tumours, developmental
abnormalities and foetal deficiencies, blood disorders, diseases of the
immune system, autoimmune diseases, inflammation, allergies, Alzheimer's
and cognitive disorders, scherosclerosis, diabetes, cardiovascular
clisorders, kidney disorders, digestive/endocrine disorders, infections
and AIDS. The polypeptides are also useful for identifying their binding
partners. The sequences given in AAX97907 to AAX97915 and AAX3623 are
used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; nootropic; neuroprotective; cytostatic; dermatological; virucide; immunosuppressive; antiinflammatory; anti-HIV; antibacterial; vulnerary; antiparkinsonian; antisickling; antianaemic; antiarthritic; cancer; antirhemmatic; hepatotropic; cerebroprotective; antiinflammatory; antiillergic; antidiabetic; antiuloer; anticonvulsant; antifungal; antiparasitic; cardiant; immune disorder; cardiovascular disorder; neurological disease; infection; nephrotropic; gene therapy; vaccine.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are used isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful. The nucleic acids, proteins, antibodies and (ant) agonists are useful. The nucleic acids, proteins, antibodies and (ant) agonists are useful. The nucleic acids, proteins, antibodies and (ant) agonists are useful. The nucleic and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (D) immune disorders e.g. Addison's disease, allergies, autoimmune characters e.g. Addison's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal and parasitic infections diseases such as viral, bacterial, fungal printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.
Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genttal diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, as and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to
                                                                                                                                                    Gaps
human liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #2310 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -

                                                                                           ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human feetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying. Seque expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, human heart and vascular system e.g. cardiovascular diseases of the human heart and vascular system e.g. cardiovascular disease. Hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                   Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide #2277 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Probe; human; microarray; gene expression; cervical epithelial cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                Human brain expressed single exon probe encoded protein SEQ ID NO: 27750.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived
                                                                            The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #2390 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel single exon nucleic acid probes (see AA10010-AA110667). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting diagnosing, grading, staging, monitoring and prognosling diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
